ABSTRACT

This report contains estimates for families, unrelated individuals, and persons by money income and poverty status for the United States, the Northeast region of the U.S., and the divisions and states within the region. The estimates were obtained from the Survey of Income and Education (SIE), which was conducted between April and July 1976 by the Bureau of the Census. This report updates 1970 census money income and poverty estimates for these areas. The report consists of three basic tables comprising six pages of data for all states and divisions within the region. The first table contains income distributions for families and unrelated individuals cross classified by a broad range of socioeconomic and demographic characteristics. The second table contains a selection of similar data for persons by sex. In the third table, data for the poverty population are shown for a broad range of characteristics. The characteristics include residence, tenure, type of family, size of family, number of related children under 18 years of age, number of earners, age, race, occupation, work experience, education, duration of unemployment, main reason for not working, type of income, subsidized housing of renters, and living arrangements for unrelated individuals. ACKNOWLEDGMENTS

This report was prepared by **Karen K. Apple**, **Gordon W. Green, Jr.**, and **Arno I. Winard**, under the direction of **Roger A. Herriot**, then Chief of the Income and Poverty Statistics Branch. Programming assistance was provided by **Emmett F. Spiers** and **Robert W. Cleveland.** Assistance in review of the text and tables was provided by **Angela M. Feldman**, **Kathryn K. Grossman**, **Pauline Koustenis**, **Renée Miller**, **Helen Ogle**, **Rosemary Schade**, **Anthony Franco**, and **Gloria A. Thomas.** Editing and copy preparation was coordinated by **Vivian J. Brown.** Overall direction was provided by **Murray S. Weitzman**, then Assistant Division Chief (Socioeconomic Statistics Programs), Population Division.

The overall coordination of the Survey of Income and Education was provided by **George H. Gray**, assisted by **Gertrude B. Odom**, Demographic Surveys Division. Sample design and selection, sample weighting, and computation of sampling variances were conducted by **Paul J. Bettin** and **Donald M. Luery**, under the direction of **David V. Bateman**, Statistical Methods Division. Editing and data file preparation were performed by **Thelma N. Varhach**, **Donna E. Armiger**, and **Barry G. Fink**, under the direction of **Robert G. Munsey**, Demographic Surveys Division. Income editing and allocation procedures were developed by **Donald R. Dalzell** and **John F. Coder**. An evaluation of the survey results was conducted by **Robert Fay**, Statistical Research Division, and **John F. Coder**, Population Division.

The data were collected under the direction of **Robert C. Jung**, Field Division. Special credit goes to the 2,500 interviewers who obtained the data.

Money Income and Poverty Status in 1975 of Families and Persons in the United States and the Northeast Region, by Divisions and States

(Spring 1976 Survey of Income and Education)

INTRODUCTION

This report contains estimates for families, unrelated individuals, and persons by money income and poverty status in 1975 for the United States, the Northeast region, and the divisions and States within the region. The estimates were obtained from the Survey of Income and Education (SIE), which was conducted between April and July 1976 by the Bureau of the Census. This report updates 1970 census money income and poverty estimates for these areas. Similar reports are available for each of the remaining three major census regions in the Nation.

In order to facilitate geographical comparisons, this report consists of three basic tables comprising six pages of data for all States and divisions within the region. The first table contains income distributions for families and unrelated individuals cross-classified by a broad range of socioeconomic and demographic characteristics similar in content to data published from the Current Population Survey (CPS). These characteristics include residence, tenure, type of family, size of family, number of related children under 18 years old, number of earners, age, race, occupation, work experience, and education. The second table contains a selection of similar data for persons, by sex. In the third table, data for the poverty population are shown for a broad range of characteristics. In addition to many of the characteristics mentioned above, the third table includes information on duration of unemployment, main reason for not working, type of income, subsidized housing of renters, and living arrangements for unrelated individuals.

In constructing a report of this nature, decisions had to be made on the selection of data to be shown at each geographical level. Although a broad range of information is shown at the State level, it was decided not to show extensive cross-classifications of these data by race and Spanish origin at the State level. This approach would have resulted in statistically unreliable data for many of the States with only a small number of observations by race and Spanish origin. The basic tables, however, are shown by race and Spanish origin for divisions, regions, and the United States. All derived measures (means, medians, poverty rates, etc.) were suppressed for a given distribution if the base had less than 60 sample cases. However, if the base is small, or if the standard error is large, care should be exercised when making comparisons between categories. Additional discussion of these considerations can be found in the appendix in the section, "Source and Reliability of the Estimates."

DESCRIPTION OF THE SIE

As mentioned above, the estimates in this report were obtained from the Survey of Income and Education (SIE). The SIE was undertaken to fulfill a legislative requirement mandated by Congress for estimates in each State of the number of children 5 to 17 years of age in poverty families. The SIE also satisfies another requirement mandated by Congress, which directs the Department of Health, Education, and Welfare [HEW] to estimate from a survey the number of children and other persons in the States who, because of limited English-speaking ability, are in need of bilingual education, guidance, and counseling.

In addition to collecting income data needed to determine poverty status, the opportunity presented by such a large survey was also used to gather some additional income-related information not usually collected in the Census Bureau's current income surveys. Such data include the receipt of food stamps, housing costs for homeowners and renters, and estimated cash assets. Also, information relevant to a number of HEW programs was collected, including data on school enrollment, child and adult disability, and health insurance coverage.

Approximately 191,500 households were selected for the SIE sample and were spread through every State in the Nation and the District of Columbia. Interviewers made personal visits to the sample households. Interviews were conducted with a responsible adult in the household and lasted approximately 45 minutes. The final interview rate for the approximately 158,500 occupied housing units was 95.4 percent.

COMPARABILITY OF ESTIMATES FROM THE SIE AND CPS

In comparing income and poverty statistics from various surveys and censuses, some differences in the estimates are to be expected even if they are for the same time period and use the same basic income concepts. Accordingly, the SIE data on income and poverty, which were for the calendar year 1975, differ somewhat from the 1975 data based on the CPS.

In general, the estimates of median income from the SIE are slightly higher than comparable estimates from the CPS. For example, the median family income from the SIE was $14,094 compared to $13,719 from the CPS. Estimates of the number of persons below the poverty level by various characteristics from the SIE are generally lower than from the CPS. For example, there were 23,991,000 persons below the poverty level in 1975 from the SIE compared to 25,877,000 from the CPS.

Although the money income concept and the questionnaire wording and design were the same for both surveys, there were some significant procedural differences which probably caused the income estimates in these surveys to differ. These differences center on the four main areas described below: (1) survey objectives, (2) month of interview, (3) conditioning of respondents and mode of interview, and (4) interviewer experience.

1. Survey objectives. The major objective of the SIE was to collect accurate income information for each State and the District of Columbia. The primary purpose of the CPS is to obtain accurate statistics on the labor force, e.g., the unemployment rate with income information added as a supplement in March. Presumably the increased emphasis on collection of income data in the training of SIE interviewers and the introductory letters to respondents led to better (i.e., more complete) reporting and thus contributed to differences in the results between the two surveys.

2. Month of interview. Virtually all interviews in the March 1976 CPS were conducted during the week of March 14 to 20. Only a small number of households were interviewed during the succeeding week. The SIE interviews took place, for the most part, in May and June, with a small number of interviews occurring in April and July. Since respondents often consult their tax returns in answering survey questions on income, the fact that the CPS interviews took place before the general April 15 deadline for filing tax returns may have disadvantages compared to the SIE. On the other hand, collection of data in May, June, and July for the SIE may have created significant recall problems for income and work experience during 1975.

3. Conditioning of respondents and mode of interview. It has been well documented that the repeated interviews of CPS sample households result in decreased respondent cooperation as the number of interviews increases. The SIE did not encounter these problems since all households were, in effect, being interviewed for the first time. In addition, respondent cooperation to answer income questions is affected by the mode of interview. Interviewers tend to be able to secure more complete income information in a personal interview than a telephone interview. Whereas extensive use is made of the telephone interviews in the CPS, almost all of the SIE data were collected in personal interviews.

Preliminary analysis of the SIE data file indicates significantly lower nonresponse rates for income than those for the March 1976 CPS. Respondent conditioning and telephone interviews in the CPS are probably contributing factors to the differing income nonresponse rates.

4. Interviewer experience. It was necessary to hire a large number of new, temporary interviewers for the SIE. In contrast, the interviewers used for the CPS tend to be highly trained and experienced in household surveys.

COMPARABILITY OF ESTIMATES FROM THE SIE AND 1970 CENSUS

Caution should be exercised when comparing estimates from the SIE with those from the 1970 census because of numerous conceptual, collection, and processing differences. The income data from the SIE are based on responses to questions on 11 separate types of income, whereas in the census only six questions were used. Also, the household relationship definitions are somewhat different. For example, in the SIE college students living away from home are treated as family members at their family's home rather than as unrelated individuals living at their college residence. On the other hand, about 400,000 persons classified as secondary family members in the SIE and CPS are classified as unrelated individuals in the census. Furthermore, persons living in military barracks and inmates of institutions were included in the 1970 census but were excluded from the SIE. The SIE interviewers had more intensive training on collecting income data and closer supervision than the large number of temporary census enumerators and consequently may have been able to obtain more accurate answers from respondents. Furthermore, as previously indicated, almost all the data in the SIE were obtained by personal interview, whereas approximately 60 percent of the households reported on mail questionnaires in the 1970 census.

In addition, there are numerous processing differences between the census and the SIE. Particularly important are the procedures used to impute missing or incomplete income responses. The SIE data were processed using a much improved system recently adopted for processing the March CPS.[1] Such procedures can have important effects in the estimates and should be taken into consideration when comparing the SIE and census data.

---

RELATED REPORTS

Similar reports are available for each of the remaining three major regions in the Nation and are published in the **Current Population Reports,** Series P-60. Each regional report will contain the same set of income and poverty characteristics as shown in this report, repeated for the divisions and each State within the region, and for the region and the total United States.

Another report containing estimates of 1975 household income from the SIE has been published as **Current Population Reports,** Series P-60, No. 108. This report updates 1970 census household money income estimates for States, divisions, regions, and the United States. The primary focus of this report was to show income distributions by housing tenure and type of residence, cross-classified by age of head and other key characteristics of households. Added emphasis has been placed on showing summary statistics; in addition to mean and median incomes, average household size and per capita income are shown along with each income distribution.

An additional report is planned which will show data from the SIE by selected characteristics such as family status, age, race, education, employment status, migration, income, and poverty. Where appropriate, this report will include comparisons between SIE and 1970 census data.

Independent estimates of the population by race for States can be found in another Census Bureau report, **Current Population Reports,** Series P-23, No. 67. The independent estimates were derived using administrative sources from the Internal Revenue Service and the Social Security Administration. In the present report, the population estimates by race were controlled at the national level but not at the State level. The standard errors on population estimates can be found in the poverty table shown for each State, division, and region.

Current Population Survey (CPS)

Money income. Data based on the CPS showing the distribution of households, families, unrelated individuals, and persons by income levels, have been published in the Series P-60 reports, Nos. 1 to 107 and 109. A report showing detailed income data in 1975 cross-classified by selected characteristics of families, unrelated individuals, and persons was issued as P-60, No. 105. An advance report showing estimates for families, unrelated individuals and persons by money income and poverty status in 1976 was issued as P-60, No. 107. A report showing detailed income data in 1976 for households was issued as P-60, No. 109.

Projections of money income size distributions have been prepared from the CPS and appear in Series P-23, No. 47, "Illustrative Projections of Money Income Size Distributions for Families and Unrelated Individuals." Projections have been prepared for families and unrelated individuals by age in 1971 constant dollars for the following years: 1975, 1980, 1985, and 1990.

Data on the educational attainment and income of men have been assembled from information collected in the CPS. These data appear in Series P-60, No. 92, "Annual Mean Income, Lifetime Income, and Educational Attainment of Men in the United States, for Selected Years 1956 to 1972." Included in the report are annual mean income and estimates of expected lifetime income in current dollars and in constant (1972) dollars, by educational attainment and age group, for all males and for male year-round full-time workers.

An historical and analytical summary of the income data collected in the CPS appears in Technical Paper No. 17, Trends in the Income of Families and Persons in the United States: 1947 to 1964, published in 1967. This report contains detailed tables showing income distributions in constant (1964) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, nonfarm and farm. Similar data are also shown for males and females classified by the amount of their own income and various personal characteristics.

Poverty. A detailed explanation of the poverty concept appears in **Current Population Reports,** Series P-23, No. 28, "Revision in Poverty Statistics, 1959 to 1968" and in **The Measure of Poverty,** A Report to Congress as Mandated by the Education Amendments of 1974, prepared by a Poverty Studies Task Force under the auspices of the Department of Health, Education, and Welfare. This report also discusses limitations of the current poverty definition and presents alternative methods for measuring poverty.

A detailed description of the original poverty index developed by the Social Security Administration appears in the following articles by Mollie Orshansky published in the Social Security Bulletin: "Counting the Poor: Another Look at the Poverty Profile," January 1965, and in "Who's Who Among the Poor: A Demographic View of Poverty," July 1965.

Data on poverty based on the original poverty definition appear in **Current Population Reports,** Series P-60, No. 54, "The Extent of Poverty in the United States: 1959 to 1966."

Data on poor persons and families based on the revised definition of poverty appear in Series P-60, Nos. 68 to 107. A report showing detailed characteristics of the poverty population in 1975 from the CPS was issued as P-60, No. 106. Advance data on the population below the poverty level in 1976 cross-classified by selected characteristics appear in **Current Population Reports,** Series P-60, No. 107, "Money Income and Poverty Status of Families and Persons in the United States: 1976."

Decennial Census

Money income. Income data collected in the 1970 Census of Population appear in a number of published reports. Basic distributions of families and unrelated individuals, by money income in 1969, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in **1970 Census of Population,** Vol. I, **Characteristics of the Population,** chapter C, "General Social and Economic Characteristics." Statistics on income of persons 14 years old and over, households, families, and unrelated individuals in 1969 by detailed characteristics, including cross-classifications by age, weeks worked, education, type of family, etc., are presented in **1970 Census of Population,** Vol. I, **Characteristics of the Population,** chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States and standard metropolitan statistical areas of 250,000 inhabitants or more.

Detailed cross-classifications of income of families and persons by social and economic characteristics are presented in Vol. II, Subject Reports: 8A, Sources and Structures of Family Income; 8B, Earnings by Occupation and Education; and 8C, Income of the Farm-Related Population. Other statistics on income are included in Vol. II reports on other subjects and in some reports of the **1970 Census of Housing.** Reports of the 1960, 1950, and 1940 censuses also contain various statistics on income.

Poverty. Poverty data collected in the 1970 Census of Population appear in a number of published reports. Selected characteristics of persons, families, and unrelated individuals below the poverty level, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in **1970 Census of Population,** Vol. I, **Characteristics of the Population,** chapter C, "General Social and Economic Characteristics." Statistics on poverty status in 1969 of persons and families by detailed characteristics, including cross-classifications by race, age, weeks worked, education, type of family, etc., are presented in **1970 Census of Population,** Vol. I, **Characteristics of the Population,** chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States, and standard metropolitan statistical areas of 250,000 inhabitants or more. Further information is contained in Data Access Description No. 29, Collection, Evaluation, and Processing Series CEP-7, "Low-income Data from the 1970 census."

Cross-classifications of poverty status in 1969 for persons and families by detailed social, economic, and housing characteristics are presented in **1970 Census of Population,** Volume II, Report PC(2)-9A, "Low-Income Population." Tables are generally for the United States, although some are repeated for regions and metropolitan-nonmetropolitan residence. Data on the social, economic, and housing characteristics of the low-income population residing in poverty areas in the 50 largest cities can be found in **1970 Census of Population,** Volume II, Report PC(2)-9B, "Low-Income Areas in Large Cities," **Supplementary Report** PC(S1)-56, "Selected Characteristics of the Population in Low-Income Areas of Large Cities," and **Supplementary Reports** PC(S1)-65 to PC(S1)-103, "Low-Income Neighborhoods in Large Cities: 1970." Selected data on the poverty status in 1969 and 1959 of persons and families for the United States, each of the States, counties, standard metropolitan statistical areas (SMSA's) and central cities of large SMSA's appear in **1970 Census of Population, Supplementary Report,** PC(S1)-105, "Poverty Status in 1969 and 1959 of Persons and Families, for States, SMSA's, Central Cities, and Counties: 1970 and 1960."

SIE MICRODATA AVAILABLE

For the data user whose needs are not met by published tabulations, the Census Bureau also has made available computerized microdata (individual respondent records) from the SIE. In order to protect the confidentiality of the respondents, no names or addresses are included in the file and geographic information is sufficiently limited to preclude the identification of any specific individual. Each State and 119 standard metropolitan statistical areas are identified on the file. Otherwise, virtually all of the information collected in the survey—from demographic characteristics such as age and race to income, poverty status, bilingualism, and disability characteristics—is made available in a form which allows the user to design his or her own tabulations. The file contains records for 151,170 households nationwide.

Further information on SIE public-use microdata is contained in **Data Access Description** No. 42, "Microdata From the Survey of Income and Education," available from the Data Access and Use Staff, Data User Services Division, Bureau of the Census, Washington, D.C. 20233.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward recognition of more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

[1] RESTRICTED TO CIVILIANS.

[2] DETAIL DOES NOT ADD TO TOTAL BECAUSE SOME FAMILIES AND UNRELATED INDIVIDUALS HAVE MORE THAN ONE OF THE TYPES OF INCOME SPECIFIED.

[3] INCLUDES UNEMPLOYMENT AND WORKMEN'S COMPENSATION, AND VETERANS' PAYMENTS.

[4] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON VALUE OF OWNED HOME.

[5] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON AMOUNT OF RENT PAID IN MONTH PRECEDING THE INTERVIEW.

Table 1A. SELECTED CHARACTERISTICS OF FAMILIES AND UNRELATED INDIVIDUALS, BY TOTAL MONEY INCOME IN 1975, FOR THE UNITED STATES–WHITE: SIE

(NUMBERS IN THOUSANDS. FAMILIES AND UNRELATED INDIVIDUALS AS OF SPRING 1976. RACE AND SPANISH ORIGIN, AGE, OCCUPATION, WORK EXPERIENCE, AND EDUCATIONAL ATTAINMENT CHARACTERISTICS ARE SHOWN FOR HUSBAND IN HUSBAND-WIFE FAMILIES AND HEAD IN OTHER FAMILIES. SEE NOTE IN TEXT. FOR MEANING OF SYMBOLS, SEE TEXT)

[1] RESTRICTED TO CIVILIANS.
[2] DETAIL DOES NOT ADD TO TOTAL BECAUSE SOME FAMILIES AND UNRELATED INDIVIDUALS HAVE MORE THAN ONE OF THE TYPES OF INCOME SPECIFIED.
[3] INCLUDES UNEMPLOYMENT AND WORKMEN'S COMPENSATION, AND VETERANS' PAYMENTS.
[4] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON VALUE OF OWNED HOME.
[5] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON AMOUNT OF RENT PAID IN MONTH PRECEDING THE INTERVIEW.

Table 1A. SELECTED CHARACTERISTICS OF FAMILIES AND UNRELATED INDIVIDUALS, BY TOTAL MONEY INCOME IN 1975, FOR THE UNITED STATES-SPANISH ORIGIN: SIE

(NUMBERS IN THOUSANDS. FAMILIES AND UNRELATED INDIVIDUALS AS OF SPRING 1976. RACE AND SPANISH ORIGIN, AGE, OCCUPATION, WORK EXPERIENCE, AND EDUCATIONAL ATTAINMENT CHARACTERISTICS ARE SHOWN FOR HUSBAND IN HUSBAND-WIFE FAMILIES AND HEAD IN OTHER FAMILIES. SEE NOTE IN TEXT. FOR MEANING OF SYMBOLS, SEE TEXT)

[1] RESTRICTED TO CIVILIANS.

[2] DETAIL DOES NOT ADD TO TOTAL BECAUSE SOME FAMILIES AND UNRELATED INDIVIDUALS HAVE MORE THAN ONE OF THE TYPES OF INCOME SPECIFIED.

[3] INCLUDES UNEMPLOYMENT AND WORKMEN'S COMPENSATION, AND VETERANS' PAYMENTS.

[4] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON VALUE OF OWNED HOME.

[5] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON AMOUNT OF RENT PAID IN MONTH PRECEDING THE INTERVIEW.

[1] RESTRICTED TO CIVILIANS.
[2] DETAIL DOES NOT ADD TO TOTAL BECAUSE SOME FAMILIES AND UNRELATED INDIVIDUALS HAVE MORE THAN ONE OF THE TYPES OF INCOME SPECIFIED.
[3] INCLUDES UNEMPLOYMENT AND WORKMEN'S COMPENSATION, AND VETERANS' PAYMENTS.
[4] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON VALUE OF OWNED HOME.
[5] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON AMOUNT OF RENT PAID IN MONTH PRECEDING THE INTERVIEW.

Table 10A. SELECTED CHARACTERISTICS OF FAMILIES AND UNRELATED INDIVIDUALS, BY TOTAL MONEY INCOME IN 1975, FOR THE MIDDLE ATLANTIC DIVISION–WHITE: SIE

(NUMBERS IN THOUSANDS. FAMILIES AND UNRELATED INDIVIDUALS AS OF SPRING 1976. RACE AND SPANISH ORIGIN, AGE, OCCUPATION, WORK EXPERIENCE, AND EDUCATIONAL ATTAINMENT CHARACTERISTICS ARE SHOWN FOR HUSBAND IN HUSBAND-WIFE FAMILIES AND HEAD IN OTHER FAMILIES. SEE NOTE IN TEXT. FOR MEANING OF SYMBOLS, SEE TEXT)

[1] RESTRICTED TO CIVILIANS.
[2] DETAIL DOES NOT ADD TO TOTAL BECAUSE SOME FAMILIES AND UNRELATED INDIVIDUALS HAVE MORE THAN ONE OF THE TYPES OF INCOME SPECIFIED.
[3] INCLUDES UNEMPLOYMENT AND WORKMEN'S COMPENSATION, AND VETERANS' PAYMENTS.
[4] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON VALUE OF OWNED HOME.
[5] RESTRICTED TO PRIMARY FAMILIES AND PRIMARY INDIVIDUALS REPORTING ON AMOUNT OF RENT PAID IN MONTH PRECEDING THE INTERVIEW.

Appendix

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and approximately 1,000,000 members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. In the SIE survey, farm residence was determined by responses to two questions: (1) "Does this place you (own/rent) have 10 acres or more?," and (2) "During the past 12 months, how much did sales of crops, livestock and other farm products from this place amount to (under $50, $50 to $249, $250 to $999, or $1,000 or more)?" The household was classified as in the farm population if either (a) the acreage response was "Yes" and sales amounted to $50 or more, or (b) the acreage response was "No" and sales amounted to $250 or more. All other households were classified as in the nonfarm population, which comprises persons living in urban areas and rural persons not on farms. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are classified as nonfarm population.

In August 1975, the U.S. Department of Agriculture and the Bureau of the Census announced a change in the official definition of a farm. Under the new definition, as used in the 1974 Census of Agriculture, a farm is any place from which $1,000 or more of agricultural products were sold, or would normally be sold, from the place in the reporting year. However, for purposes of comparability with existing data sources, the figures presented in this report are based on the earlier definition.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties. The figures shown in this report for SMSA's are based on the SMSA's as defined on the basis of the 1970 census.

Poverty areas. For this report poverty areas in metropolitan areas are defined in terms of census tracts and in nonmetropolitan areas in terms of minor civil divisions (townships, districts, etc.) in which 20 percent or more of the population was below the low-income level in 1969. For further details, see **1970 Census of Population Report** PC(2)-9B, "Low-Income Areas in Large Cities," and Supplementary Reports PC(S1)-65 to PC(S1)-103, "Low-income Neighborhoods in Large Cities: 1970."

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Geographic regions. The four major regions and nine Census divisions of the United States represent groups of States, as follows:

Northeast:

New England: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont.

Middle Atlantic: New Jersey, New York, Pennsylvania.

North Central:

East North Central: Illinois, Indiana, Michigan, Ohio, Wisconsin.

West North Central: Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, South Dakota.

South:

South Atlantic: Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, West Virginia.

East South Central: Alabama, Kentucky, Mississippi, Tennessee.

West South Central: Arkansas, Louisiana, Oklahoma, Texas.

West:

Mountain: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming.

Pacific: Alaska, California, Hawaii, Oregon, Washington.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent. For renter-occupied units, information was also obtained as to whether the unit was publicly owned or subsidized by the Federal, State, or local government.

Mean value. The mean value is the sum of the individual values reported divided by the number of owner-occupied units reporting on value of owned home.

Mean rent. The mean rent is the sum of the individual rental amounts divided by the number of renter-occupied units.

Income. For each person in the sample 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) Supplemental Security income; (6) public assistance or welfare payments; (7) interest (on savings or bonds); (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and workmen's compensation; (10) private pensions or government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., $10,000 to $15,000 was coded as $12,500). Open-ended amounts were converted to designated specific amounts; e.g., over $10,000 may be coded as $15,000.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on consumer income collected in the SIE by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. From an analysis of independently derived income estimates, it has been determined that wages and salaries tend to be much better reported than such income types as public assistance, Social Security, and net income from interest, dividends, rents, etc.

The various sources for which income is reported are defined as follows:

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of saleable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes, otherwise, inventory changes were not taken into account.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government. "Medicare" reimbursements are not included.

Supplemental Security income includes payments made by Federal, State, and local welfare agencies to low income persons who are (1) aged (65 years old or over), (2) blind, or (3) disabled.

Public assistance or welfare payments include public assistance payments such as aid to families with dependent children and general assistance.

Dividends, interest (on savings or bonds), income from estates or trusts, net rental income or royalties include dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Unemployment compensation, veterans' payments, or workmen's compensation include: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) money paid periodically by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (3) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private and government employee pensions include: (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors.

Annuities, alimony, regular contributions from persons not living in the household, and other periodic income include the following types of income: (1) Periodic receipts from annuities or insurance; (2) alimony and child support; (3) contributions received periodically from persons not living in the household; (4) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings—the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment.

Income other than earnings—the algebraic sum of all sources of money income except wages and salaries and income from self-employment.

Total money income. The algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings represents total money income. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

The income tables for families and unrelated individuals include in the lowest income group (under $2,000) those who were classified as having no income in the income year and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, unrelated individuals who had recently left families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families and unrelated individuals who reported no income probably had some money income which was not recorded in the survey.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

Estimates of median income and associated standard errors which occur in income intervals of greater than $1,000 have been calculated using Pareto interpolation. This method of interpolation assumes a decreasing density of population within an income interval, thus making it most applicable to the upper ranges of an income distribution. Median incomes and standard errors were calculated from a more detailed income distribution than shown in any of the tables in this report.

It has been established that the Pareto interpolation method is more accurate than linear interpolation for estimating values in the higher income groups. In contrast to the linear method, the Pareto techniques use logarithms and is applied to an income distribution cumulated from the highest to the lowest income intervals. For more information on the use of Pareto techniques, see "Estimation of Summary Measures of Income Size Distribution From Grouped Data," by Emmett F. Spiers, published in the American Statistical Association, **Proceedings of the Social Statistics Section,** 1977.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group (families, unrelated individuals or persons). The means for families and unrelated individuals are based on all families and individuals. The means for persons are based on the number of persons with income. The mean for a particular type of income is based on the number of persons or families with that particular type of income.

Poverty (low-income) definition. Poverty statistics presented in this report are based on a definition developed by the Social Security Administration in 1964 and revised by a Federal Interagency Committee in 1969.

Statistics presented in Census Bureau reports prior to publication of **Current Population Reports,** Series P-60, No. 68, "Poverty in the United States, 1959 to 1968," were based on the poverty index developed by the Social Security Administration (SSA) in 1964. This index provided a range of income cutoffs adjusted by such factors as family size, sex of the family head, number of children under 18 years old, and farm-nonfarm residence. At the core of this definition of poverty was the economy food plan, the least costly of four food plans that are nutritionally sound, designed by the Department of Agriculture. It was determined from the Department of Agriculture's 1955 survey of food consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. Annual revisions of these SSA poverty cutoffs were based on price changes of the items in the economy food budget.

As a result of deliberations of a Federal Interagency Committee in 1969, the following two modifications to the original SSA definition of poverty were recommended: (1) that the SSA thresholds for nonfarm families be retained for the base year 1963, but that annual adjustments in the levels be based on changes in the Consumer Price Index (CPI) rather than on changes in the cost of food included in the economy food plan; and (2) that the farm thresholds be raised from 70 to 85 percent of the corresponding nonfarm levels. The combined impact of these two modifications resulted in an increase of 360,000 poor families and 1.6 million poor persons in 1967. The reasons for making these changes are outlined below.

Change in cost of living adjustment. Annual revisions of the SSA poverty thresholds were based only on the average per capita cost of the foods in the economy food budget. This method of updating these cutoffs did not fully reflect increases in the overall cost of living during the 1960's. The pace at which the general cost of living advanced in the 1960's was not uniformly matched by increases in the price of goods in the economy food plan. Thus, general price changes since 1959 were not paralleled by comparable changes in the poverty thresholds. The differences between changes in the cost of the economy food budget and the overall cost of living led to the adoption of the CPI as the basis for annual revisions in the income cutoffs.

Change in the farm-nonfarm relationship. Under the old definition, the poverty thresholds for farm families were adjusted for the average value of food consumed by these families which they had grown themselves. Based on a 1961 study of household consumption which indicated that the value of food produced by farm families for home use amounted to about 30 percent of their total food budget, the poverty cutoffs for farm families were established at 70 percent of the nonfarm levels.

Up to the present time, no entirely satisfactory means of determining the income required for equivalent levels of living for farm and nonfarm families has been provided by studies on this subject. Further research is needed to analyze the differences in the costs between farm and nonfarm families. Although it is not yet possible to quantify exactly all the factors contributing to cost of living differences between farm and nonfarm families, research already completed suggests that the differences are not as great as provided for by the 70 percent differential. After weighing the available evidence, the Review Committee agreed that narrowing the farm-nonfarm differential to 85 percent more nearly reflects the overall cost of living differences between farm and nonfarm families than the previously used differential.

Poverty thresholds are computed on a National basis only. No attempt has been made to adjust these thresholds for regional, State, or other local variations in the cost of living (except for the farm-nonfarm differential described above).

Alternate levels. Because the poverty definition currently in use by the Federal Government does not meet all the needs of the analysts of the data, additional data are presented for alternate definitions ranging from 75 percent to 200 percent of the current poverty level. Alternate cutoffs

Table A-1. Income Thresholds at the Poverty Level in 1975 by Sex of Head, Size of Family, and Number of Related Children Under 18 Years Old, by Farm-Nonfarm Residence

Size of family unit	Number of related children under 18 years old						
	None	1	2	3	4	5	6 or more
NONFARM							
Male Head							
1 person (unrelated individual):							
Under 65 years	$2,902						
65 years and over	2,608						
2 persons:							
Head under 65 years	3,629	$4,065					
Head 65 years and over	3,258	4,065					
3 persons	4,224	4,361	$4,610				
4 persons	5,569	5,651	5,456	$5,732			
5 persons	6,721	6,802	6,584	6,418	$6,556		
6 persons	7,709	7,734	7,571	7,406	7,187	$7,297	
7 or more persons	9,708	9,792	9,599	9,435	9,217	8,886	$8,805
Female Head							
1 person (unrelated individual):							
Under 65 years	$2,685						
65 years and over	2,574						
2 persons:							
Head under 65 years	3,352	$3,660					
Head 65 years and over	3,217	3,660					
3 persons	4,088	3,894	$4,307				
4 persons	5,347	5,540	5,514	$5,456			
5 persons	6,418	6,612	6,584	6,529	$6,309		
6 persons	7,488	7,625	7,571	7,515	7,269	$7,048	
7 or more persons	9,407	9,545	9,517	9,435	9,189	8,997	$8,558
FARM							
Male Head							
1 person (unrelated individual):							
Under 65 years	$2,466						
65 years and over	2,216						
2 persons:							
Head under 65 years	3,084	$3,454					
Head 65 years and over	2,769	3,454					
3 persons	3,591	3,707	$3,918				
4 persons	4,734	4,805	4,637	$4,872			
5 persons	5,713	5,782	5,595	5,455	$5,572		
6 persons	6,552	6,574	6,436	6,295	6,109	$6,202	
7 or more persons	8,254	8,324	8,161	8,020	7,835	7,554	$7,485
Female Head							
1 person (unrelated individual):							
Under 65 years	$2,282						
65 years and over	2,187						
2 persons:							
Head under 65 years	2,850	$3,111					
Head 65 years and over	2,735	3,111					
3 persons	3,473	3,310	$3,661				
4 persons	4,547	4,708	4,687	$4,637			
5 persons	5,455	5,620	5,595	5,549	$5,363		
6 persons	6,366	6,482	6,436	6,389	6,179	$5,991	
7 or more persons	7,995	8,115	8,090	8,020	7,811	7,647	$7,274

are obtained by multiplying the income cutoffs at the poverty level by the appropriate factor. For example, the income cutoff at 125 percent of the poverty level was $6,875 in 1975 for a nonfarm family of four persons.

Weighted average thresholds at the poverty level. The low-income cutoffs used by the Bureau of the Census to determine the low-income status of families and unrelated individuals consist of a set of 124 thresholds arranged in a four-dimensional matrix consisting of family size (from one person, i.e., unrelated individuals, to seven or more person families) cross-classified by presence and number of family members under 18 years old (from no children present to six or more children present); sex of head, and farm-nonfarm residence (table A-1). Unrelated individuals and two-person families are further differentiated by age of head (under 65 years and 65 years and over). The total family income of each family in the sample is tested against the appropriate dollar threshold to determine the low-income status of that family. If the family's total income is less than its corresponding cutoff, the family is classified as below the low-income level. The average thresholds shown in table A-2 were weighted by the presence and number of children. For example, for a given size of family, sex of head, and residence category, the weighted average threshold for that group is obtained by multiplying the threshold for each presence and number of children category within the given family size by the number of families in that category. These products are then aggregated across the entire range of presence and number of children categories, and the total aggregate is divided by the total number of families in the group to yield the weighted average threshold at the low-income level for that size family.

Because family composition varies by farm-nonfarm residence, the weighted average thresholds at the poverty level for farm families, as shown in table A-2 will not be exactly 85 percent of the nonfarm levels. Moreover, since family composition does not remain constant from year to year, the weighted average thresholds for 1975 will not reflect, identically, the change in the CPI between 1975 and earlier years.

Since the basic thresholds used to determine the low-income status of families and unrelated individuals are applied to all families and unrelated individuals, the weighted poverty thresholds are derived using all families and unrelated individuals rather than just those families and unrelated individuals classified as below the low-income level.

Income deficit. Income deficit is the difference between the total income of families and unrelated individuals below the low-income level, and their respective income thresholds. In computing the income deficit, families reporting a net income loss are assigned zero dollars and for such cases the deficit is equal to the low-income threshold. This measure provides an estimate of the amount which would be required to raise the incomes of all low-income families and unrelated individuals to their respective low-income thresholds. The income deficit is thus a measure of the degree of impoverishment of a family or unrelated individual. However, caution must be exercised in comparing the average deficit of families of different racial groups. Since the low-income thresholds used in this report are based on family size and composition, apparent differences in the average income deficits of racial groups may, to some extent, be a function of the differences in these characteristics. It must also be remembered that the thresholds in this report vary according to the sex of the family head. Thus, differences in the average deficit between families with a male or female head may be in part attributable to both differences in thresholds and to differences in family size and composition.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group

Table A-2. Weighted Average Thresholds at the Poverty Level in 1975 by Size of Family and Sex of Head, by Farm-Nonfarm Residence

Size of family unit	Total	Nonfarm			Farm		
		Total	Male head[1]	Female head[1]	Total	Male head[1]	Female head[1]
1 person (unrelated individual)..	$2,717	$2,724	$2,851	$2,635	$2,305	$2,396	$2,224
14 to 64 years..................	2,791	2,797	2,902	2,685	2,396	2,466	2,282
65 years and over..............	2,572	2,581	2,608	2,574	2,196	2,216	2,187
2 persons........................	3,485	3,506	3,515	3,460	2,955	2,963	2,834
Head 14 to 64 years............	3,599	3,617	3,636	3,530	3,079	3,086	2,933
Head 65 years and over.........	3,232	3,257	3,260	3,237	2,772	2,772	2,770
3 persons........................	4,269	4,293	4,317	4,175	3,643	3,652	3,480
4 persons........................	5,469	5,500	5,502	5,473	4,695	4,697	4,616
5 persons........................	6,463	6,499	6,504	6,434	5,552	5,552	5,595
6 persons........................	7,272	7,316	7,322	7,270	6,224	6,230	6,105
7 persons or more................	8,939	9,022	9,056	8,818	7,639	7,639	7,647

[1] For one person (i.e., unrelated individual), sex of the individual.

of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. All persons who are not members of households are regarded as living in group quarters. Group quarters are living arrangements for groups containing five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses. Persons living in military barracks and inmates of institutions were excluded from the survey.

Family. The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not a part of the household head's family.

Primary family. A primary family is a family that includes among its members the person or couple who maintains the household.

Unrelated individuals. The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Primary individual. A primary individual is a person maintaining a household while living alone or with nonrelatives only.

Head of family. One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples related to the head of a family are included in the head's family and are not classified as separate families.

Married, wife present. A man was classified as "married, wife present" if his wife was reported as a member of the household or group quarters, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration.

Size of family. The term "size of family" refers to the number of persons who are living together and are related to each other by blood, marriage, or adoption.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the family head. "Related" children in a family include own children and all other children in the household who are related to the family head by blood, marriage, or adoption.

Number of earners. This number includes all persons in the family with $1 or more in wages and salaries, or $1 or more or a loss in net income from farm or nonfarm self-employment.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. It should be noted that persons of Spanish origin may be of any race.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Duration of unemployment. The duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment.

Mean number of weeks unemployed is the sum of the single weeks of unemployment reported divided by the total number of weeks unemployed.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians 14 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Paid labor force. Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as wage and salary or self-employed workers.

Occupation, industry, and class of worker. The data on occupation and employment status refer to the job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The data on occupation and industry refer to the job held longest during the income year.

The major occupation groups are combined into four divisions, as follows:

White-collar workers.—Professional, technical, and kindred workers; managers and administrators, except farm; sales workers; and clerical and kindred workers.

Blue-collar workers.—Craft and kindred workers; operatives, except transport; transport equipment operatives; and laborers, except farm.

Farm workers.—Farmers and farm managers; and farm laborers and supervisors.

Service workers.—Service workers, excluding private households; and private household workers.

The sequence in which these four divisions appear is not intended to imply that any division has a higher social or skill level than another.

Work experience. A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year, if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Nonworker. A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Main reason for working part year. For persons who worked 1 to 49 weeks during the year, the main reason for working part year is based on the response to the question "What were you doing most of the remaining weeks?"

Main reason for not working. For persons who reported that they did not work at a civilian job for pay or profit or on a family-operated farm or business during the year, the main reason for not working is derived from the response to the question "What were you doing most of last year?"

Symbols. A dash "–" represents zero or rounds to zero. The symbol "B" means that the base for the derived figure is less than 60 sample cases. Three dots "..." mean not applicable, and "NA" means not available.

Rounding. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded.

Base figures. The base figures shown in this report were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from 1970 census.

LIMITATIONS OF THE POVERTY CONCEPT

In analyzing data on the low-income population, the following limitations should be noted. The low-income concept has been developed in order to identify, in dollar terms, a minimum level of income adequacy for families of different types in keeping with American consumption patterns. Based on an analysis of the percent of income devoted to food expenditures, an estimate was developed of the minimum cost at which an American family, making average choices, can be provided with a diet meeting recommended nutritional goals. Consequently, it is an overall statistical yardstick which reflects the different consumption requirements of families of different size, taking into account family composition and farm-nonfarm residence. Insofar as individual circumstances or consumption patterns differ, the dollar value of the low-income threshold for a given family size may not represent the money income required by an individual family to maintain a level of economic well being equivalent to other families with similar incomes. For a discussion of the limitations of money income as a measure of economic status, see "Trends and Composition of the Low-Income Population," by Renee Miller and Arno Winard, **Proceedings of the Social Statistics Section,** American Statistical Association, 1974.

The original intent of the poverty definition was not for administrative use in any specific program; it was to be a statistical yardstick. In April 1973, the Interagency Committee on Income Distribution and Poverty was requested by the Statistical Policy Division of the Office of Management and Budget to conduct a thorough review of the statistics on income and poverty. Three subcommittees, one focusing on updating the poverty threshold, another on measuring cash income, and the third on measuring noncash income, met throughout the summer of 1973 and came up with a number of recommendations. One of the conclusions reached by the subcommittee on updating the poverty threshold was that the development of separate measures for eligibility in programs should receive high priority. For a summary of the research recommendations of the Interagency Committee see "Review of Poverty and Income Distribution Statistics" by Bette S. Mahoney, **Statistical Reporter,** Statistical Policy Division, Office of Management and Budget, January 1974.

A detailed review of the poverty definition has recently been completed. The Education Amendments of 1974 required the Assistant Secretary of Education, Department of Health, Education, and Welfare, to supervise a "thorough study of the manner in which the relative measure of poverty for use in the financial assistance program authorized by Title I of the Elementary and Secondary Education Act of 1965 may be more accurately and currently developed." At the end of 1974 an interagency Poverty Studies Task Force was established under the leadership of HEW which undertook an intensive review of the present definition of poverty and of the implications of various alternative measurement schemes. The findings of this study have been summarized in the report entitled "The Measure of Poverty" which was transmitted to Congress in April of 1976. Additional information about the study as well as requests for copies of the report should be addressed to: Mr. George Grob, Department of Health, Education, and Welfare, Room 445-G Humphrey Building, Washington, D.C. 20201.

COMPARABILITY OF SIE DATA WITH DATA FROM OTHER FEDERAL SOURCES

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Department of Commerce.

The lack of correspondence stems from the following differences in definition and coverage:

1. **Income definition.** The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and

fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges.

These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. **Source of data.** The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

3. **Population coverage.** The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

4. **Average income.** The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for families (or for unrelated individuals or income recipients 14 years old and over).

Department of Agriculture farm income series. The farm income data are not directly comparable to that published by the Department of Agriculture for several reasons. The Department of Agriculture publishes two major series on income of the farm population: (1) Personal income of the farm population and (2) realized net farm income of farm operators.

Because of the following reasons, the estimates of total money income of the farm population as published by the Bureau of the Census are not directly comparable to estimates of personal income data of the farm population as published by the Department of Agriculture:

1. The estimates of total money income exclude the value of farm crops and other noncash income as well as income from capital gains, whereas estimates of personal income include both of these items.

2. Estimates of total money income include contributions for social insurance by farmers and farm laborers and contributions from persons living outside the household, while estimates of personal income exclude these two sources of income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' realized net farm income per farm as published by the Department of Agriculture.

1. The estimates of farm self-employment income as published by the Bureau of the Census exclude nonmoney income such as crops grown for home consumption. However, these are included in the estimates of operators' realized net farm income per farm.

2. The estimates of the Bureau of the Census include in their universe, persons who do not live on a farm but who do have farm income, while the estimates of the Department of Agriculture exclude these people from their universe.

3. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

The estimates of the Department of Agriculture differ from the estimates of the Bureau of the Census methodologically as well as conceptually. The Department of Agriculture estimates are based on data derived from farm, business, and governmental sources, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the Department of Agriculture estimates, see U.S. Department of Agriculture Handbook No. 365, Major Statistical Series of the U.S. Department of Agriculture, Vol. 3, "Gross and Net Farm Income" released in Sept. 1969.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than $2,350 (less than $3,100 if 65 years old or over) and married couples receiving less than $3,400 ($4,150 if one spouse is 65 years old or over; $4,900 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', Disability, and Health Insurance earnings record data. Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors' Disability, and Health Insurance earnings record data differ for the reasons listed below:

1. The earnings of the following groups are not covered by the earnings record data: Many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers, and domestic servants.

2. Employees' earnings in excess of $14,100 per employer are not covered by the earnings record data.

3. Income other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

UNDERREPORTING OF INCOME

As in most household surveys, the estimated total amount of income received by persons derived from the SIE is somewhat less than estimated amounts derived from independent sources such as the Bureau of Economic Analysis, the Social Security Administration, and the Veterans' Administration. The difference between the survey estimate and the independent estimate is termed "underreporting."

In order to estimate the magnitude of underreporting on the SIE, estimates of aggregate money income are made from independent sources (for each income source) by adjusting aggregate income figures from these sources to SIE money income concepts. One of the more important adjustments is the exclusion of "nonmoney" income amounts such as pay to employees in the form of food or lodging or imputed rent of owner-occupied housing from aggregate personal income figures obtained from BEA. A publication covering the general topic of income underreporting is **The Distribution of Personal Income, A Study of Statistics on the Size Distribution of Personal Income in the United States,** prepared by T. Paul Schultz for use of the Subcommittee on Economic Statistics of the Joint Economic Committee, Congress of the United States, 1964. For more details regarding the procedures for developing independent estimates of aggregate income, see "Appraisal of Basic Data Available for Constructing Income Size Distributions" by Selma F. Goldsmith, published in **Studies in Income and Wealth,** Volume 13, National Bureau of Economic Research, 1951; and "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

Because of the difficulty in obtaining reliable independent estimates of aggregate income for some individual sources of income collected in the SIE, the independent estimates shown in tables A-3 and A-4 do not include figures for (1) estates or trusts, (2) alimony and child support, (3) contributions from persons not living in the household, and (4) the "anything else" category. Independent estimates of aggregate nonfarm and farm self-employment income are based on the BEA personal income series even though they pose some troublesome conceptual problems. It should also be kept in mind that the independent estimates are, themselves, subject to errors and conceptual differences for which no adequate adjustment is possible.

Table A-3 shows comparisons of SIE aggregate income amounts and independently estimated aggregate income amounts for each source of income collected in the SIE for 1975. Estimates are available for each individual source of income specified on the SIE questionnaire with the exception of those four sources for which no independent estimates are available. SIE proportions of the total independent estimates are also shown by reported and allocated status.

Comparisons of the SIE estimates with the independent totals reveal that overall income in the survey after allocation is underreported by about 6 percent. However, wide variations are found in the amount of underreporting by source of income. Underreporting was over 50 percent for interest income and workmen's compensation whereas essentially all of wage and salary income was accounted for.

Both the reported and allocated portions of SIE aggregate incomes are shown in table A-3. In 1975, $128.7 billion, or about 12 percent of the total SIE aggregate was allocated as a result of nonresponses to the income questions. The data in this table reveal that the allocated portion of SIE aggregate income varies widely by income source. About 3 percent of the $3.9 billion of the SIE Supplemental Security income in 1975 was allocated whereas about 29 percent of the $15.3 billion of dividends was allocated. Other sources of income with allocated proportions of 20 percent or above include interest and nonfarm self-employment income.

Table A-4 shows a comparison of SIE total aggregate money income amounts and independent estimates of total aggregate money income for States. Through the use of data available from the Bureau of Economic Analysis, the independent estimates of total money income by State were derived using methods similar to the methods used to develop the independent estimates shown in table A-3 on the national level. The estimates available from BEA by State do

Table A-3. Comparison of SIE Aggregate Money Income in 1975 with Independent Estimates of Aggregate Money Income Adjusted to SIE Money Income Concepts by Type of Income and Reported and Allocated SIE Amounts

not reflect 1975 revisions to personal income estimates published for the United States. In addition, some of the data required to adjust the BEA figures to census money income concepts were not readily available on a State basis. Therefore, estimates for States should only be considered rough approximations.

The reasons for underreporting of income in the SIE and in other household surveys are many and varied. Some of the more important of these reasons include: (1) respondents overlooking income received, especially small amounts not regularly received, (2) reluctance to reveal the receipt of certain income types, (3) reporting rounded amounts, (4) misunderstanding the questions, (5) lack of information especially covering family members not present during the interview, (6) interviewer's errors in recording information on the questionnaire, (7) biases in the allocation of nonresponses, and (8) errors resulting from the aggregation of the information collected from individual questionnaires.

For more details on income underreporting in censuses and surveys, see (1) **Income Distribution in the United States** (a 1960 Census Monograph), by Herman P. Miller, Bureau of the Census, 1966, (2) **The Structure of Income,** by Irving B. Kravis, University of Pennsylvania, 1962 and, (3) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" cited earlier in this section.

NONINTERVIEWS, NONRESPONSES AND ALLOCATIONS

Of the approximately 158,500 occupied housing units designated for interview in the SIE, no interviews were obtained for about 7,300 households. This represents a noninterview rate of about 4.6 percent. The main reasons for noninterviews of occupied housing units include no one home, occupants temporarily absent, and refusals. Adjustments are made to the sample weights of persons in interviewed households with similar characteristics and residing in the same area in order to account for these noninterviews.

Failure to obtain complete income information for persons who are interviewed in household surveys is a significant problem. In the SIE complete income information was not reported for about 13 percent of all persons 14 years old and over. Only about 1 percent failed to respond to all 11 of the questions covering annual money income in 1975. About 21 percent of the families in SIE contained one or more members having incomplete income information reported.

Interviewed persons who are missing income information on their questionnaire are imputed or allocated a response to each income question for which the response is missing. This allocation is carried out by assigning a response from a respondent who did report his or her income and who had similar economic and demographic characteristics. For each missing response, the assignment of a NONE ($0) or a dollar amount can occur depending on the response to that question given by the respondent from which the allocation is made.

For a general description of the SIE survey including detailed noninterview rates for States see "Description of the Survey of Income and Education Operations," by George Gray and Marvin Thompson, Bureau of the Census, pending publication in the American Statistical Association, **Proceedings of the Social Statistics Section**, 1977. A more detailed description of income nonresponse problems on the SIE can be found in "An Evaluation of Income Reporting on the Survey of Income and Education," by John Coder, Bureau of the Census, also pending publication in the American Statistical Association, **Proceedings of the Social Statistics Section**, 1977.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of the data. The estimates are based on data collected between April and July 1976 for the Survey of Income and Education (SIE), which was conducted by the Bureau of the Census in cooperation with the Department of Health, Education, and Welfare.

Approximately 158,500 households, selected independently in the 50 States and the District of Columbia, were eligible for interview in SIE. Of this number, 7,300 interviews were not obtained because the occupants were temporarily absent, refused to be interviewed, or after repeated callbacks no one could be found at home. In addition to the 158,500 households, there were about 33,000 sample units which were visited and found to be vacant, condemned, unfit, demolished, etc., and, therefore were ineligible for interview. The distribution of the occupied households, and households not occupied are shown for the United States, the region, and the divisions and States within the region in table A-5.

The sample design for the SIE sample was a stratified multi-stage cluster design. Each State was divided into areas made up of counties and independent cities referred to as primary sampling units (PSU's). These PSU's were then grouped to form strata within each State according to the proportion of persons who were children 5 through 17 years old living in poverty families at the time of the 1970 census. Some strata consisted of only one PSU (generally the larger metropolitan areas and some larger nonmetropolitan PSU's) which came into sample with certainty and which were called self-representing. In nine States (Connecticut, Delaware, District of Columbia, Hawaii, Maryland, Massachusetts, New Hampshire, Rhode Island, and Vermont) every PSU was made self-representing. In the remaining States, the PSU's which were not self-representing were grouped into strata according to regression estimates. In each of these strata, two PSU's were selected without replacement. These sample PSU's are called non-self-representing (NSR) PSU's.

The self-representing PSU's and each non-self-representing PSU in a State are called sampling areas. Within each sampling area, a sample of housing units enumerated in the 1970 Census of Population and Housing was selected. In addition, a sample of new construction building permits was also selected to represent the units constructed in areas under the jurisdictions of building permit offices (permit-issuing areas) since the 1970 census. Further, a sample of units constructed since the 1970 census in areas not under the

jurisdiction of building permit offices (non-permit-issuing areas) and units from mobile home parks established since the 1970 census were selected.

Estimation procedure. The first step in the estimation procedure involved the inflation of the sample data by the reciprocal of the probability of its selection. Next, adjustments were made to account for occupied households in which interviews were not obtained because the occupants were temporarily absent, refused to be interviewed, or after repeated callbacks no one could be found at home. This adjustment was made separately to households in different race of head-residence-1970 census poverty level categories.

In order to improve the precision of the data, the estimation procedure made extensive use of available auxiliary data on characteristics of the survey population. The source of most of this auxiliary data was geographic information about the sample units, 1970 census data and current independent population counts.

The first stage of ratio estimation was employed for sample households from NSR PSU's only. This procedure adjusted for the differences that existed at the time of the 1970 census in the distribution of persons by race and residence as estimated from the sample NSR PSU's and from the NSR population in each State. This ratio estimation was designed to reduce the variance attributable to the sampling of PSU's.

Additional stages of ratio estimation were employed to adjust for coverage problems and to bring the distribution of the sample population into agreement with the distribution of the population from which the sample was selected. The second stage of ratio estimation was only employed for new construction sample units (i.e., sample units built April 1, 1970 or later) in permit-issuing areas. The sample estimate of new construction in these areas was ratio-adjusted to agree with an independently derived estimate from the Survey of Construction (SOC), a survey of building permits conducted monthly by the Bureau of the Census.

In the third stage, the national sample estimates of civilian persons were controlled to independently derived national estimates for various age, race, and sex categories. To these totals were added the population estimates of those in the Armed Forces living off post or with their families on post. The fourth stage adjustment was made so that the husband and wife of a family received the same weight. Finally, the last stage adjusted the State sample estimates of civilian persons to agree with independently derived estimates of State population for three age categories in each State.

The last three stages in the estimation procedure were repeated in an iterative procedure in order to bring the SIE estimates into close agreement with both the national and State independent estimates. The effect of these final stages of ratio estimation, as well as the overall estimation procedure, was to reduce the error for most statistics below what would have been obtained by simply weighting the results of the SIE sample by the inverse of the probability of selection.

Reliability of the estimates. There are two types of possible errors associated with estimates based on data from a sample survey—sampling and nonsampling error. The following is a description of the sampling and nonsampling errors associated with SIE.

Nonsampling variability. In general, nonsampling errors can be attributed to many sources: Inability to obtain information about all cases, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, mistakes in recording or coding the data, and other errors of collection, response, processing, coverage, and estimation for missing data. As can be seen from the above list, nonsampling errors are not unique to sample surveys since they can, and do, occur in complete censuses as well.

It should be pointed out that steps used in the estimation procedure to reduce errors due to nonresponse and coverage deficiencies introduce nonsampling errors of their own. However, the errors introduced are believed to be smaller than the errors due to nonresponse and coverage deficiencies.

Although it would be exceptionally difficult to assess fully each source of error, an attempt was made to measure the possible effects of some of these sources as they might affect estimates from the SIE. Acting to comply with the Congressional legislation, particular effort was concentrated in evaluating the accuracy of the measurement of poverty according to the present definition. A principal component of this evaluation was a return visit, by different interviewers, to approximately 5 percent of the households in the SIE sample. For these selected households, which were concentrated in low to moderate income households, an independent interview was conducted, referring only to necessary identifying information from the first interview. The small size of the sample, approximately 9,000 designated households, permitted inclusion of features intended to produce a more accurate measurement. For example, persons age 16 and over were asked to respond for themselves, wherever possible, even when repeated callbacks to the household were required. A new questionnaire was designed to ask each respondent first about the sources of income the respondent had during 1975 and then to obtain the amount for each of these sources by detailed questions. A comparison of these reinterviews with the original interviews will measure the potential biases that the choice of survey procedures may have had on the estimates of poverty from this survey.

The second component was an evaluation of the coverage of the SIE sample frame. From 2,632 SIE sample units in primarily rural areas, four neighboring units were identified and interviews were conducted at those neighboring units which had no chance of being included in the SIE sample (i.e., missed units). In addition, interviews were conducted at missed households (households that had no chance of selection) in both rural and nonrural areas that were in approximately 6,800 structures that contained a unit from the SIE sample. The objective of this study was the measurement of coverage biases due to missed units in primarily rural areas and to missed households within structures.

A report of the evaluation study entitled "Assessment of the Accuracy of the Survey of Income and Education," has been submitted to Congress in accordance with Section 822(b) of the Educational Amendments of 1974. This report outlines principal conclusions from the re-interview study.

Sampling variability. The particular sample used for this survey is one of a large number of possible samples of the same size that could have been selected using the same sample design. Even if the same schedules, instructions, and enumerators were used, estimates from each of the different samples would differ from each other. The deviation of a sample estimate from the average of all possible samples is defined as the sampling error. The standard error of a survey estimate attempts to provide a measure of this variation among the estimates from the possible samples and, thus, is a measure of the precision with which an estimate from a sample approximates the average result of all possible samples.

As calculated for this report, the standard error also partially measures the variation in the estimates due to response and enumerator errors (nonsampling errors), but it does not measure, as such, any systematic biases in the data. Therefore, the accuracy of the estimates depends on both the sampling and nonsampling errors, measured by the standard error, and biases and some additional nonsampling errors not measured by the standard error.

The procedure, as illustrated below, provides a method to construct interval estimates such that a known proportion of the intervals would contain the average of all possible samples. For example, if all possible samples were selected, each of these surveyed under identical conditions and an estimate and its estimated standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples;
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples;
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average result of all possible samples may or may not be contained in any particular computed interval. However, for a particular sample one can say with specified confidence that the average result of all possible samples is included in the constructed interval.

The figures presented in the tables are standard errors on various estimates based on knowledge from the survey design. The tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specified item.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerators and denominators of the percentages, particularly if the percentages are 50 percent or more.

Table A-7 presents standard errors for estimated numbers in the SIE tabulations. Table A-8 presents a generalized table of standard errors for estimates of percentages. To find the standard error of a percentage for a specific State, region, division, or the United States, multiply the standard error shown in table A-8 by the factor shown in table A-6. The standard errors in tables A-7 and A-8 were developed for one specific characteristic. Therefore, these standard errors may not apply to other types of characteristics. To calculate standard errors for other types of characteristics, the factors shown in table A-9 should be applied to the standard errors presented in tables A-7 and A-8. The appropriate factor to use for a given characteristic is the one that corresponds to smallest group that completely contains the group having the characteristic. For example, to produce a standard error for an estimate of total persons in poverty multiply the standard error shown in table A-7 by the factor 1.30 shown in table A-9, and to estimate the standard error for an estimate of children less than 18 years old in poor families multiply the standard error shown in table A-7 by the factor 1.20 shown in table A-9.

Illustration of the use of the tables of standard errors. The estimate of the total number of persons in poverty in the State of New Jersey is 586,000. By linear interpolation, table A-7 shows that the standard error on an estimate of this size in New Jersey to be approximately 26,000. Multiply this number by the factor 1.30 for total persons in poverty. The final standard error associated with this estimate is 34,000 (i.e., 1.30 x 26,000). Consequently, the 68-percent confidence interval, as shown by these data, is from 552,000 to 620,000 poor persons. Therefore, a conclusion that the average estimate, derived from all possible samples, lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude that the average estimate, derived from all possible samples, lies within the interval from 518,000 to 654,000 persons with 95 percent confidence.

Of these 586,000 poor persons, 194,000 or 33.1 percent, are poor children 5 to 17 years old. By linear interpolation, table A-8 shows that the standard error on 33.1 percent (on a base of 586,000) is approximately 2.9 percentage points. The factor for the numerator of the percentage,

children 5 to 17 years old in poverty, is 1.00 and the factor for New Jersey shown in table A-6 is 0.745. Thus, the final standard error is 2.2 percent (2.9 x 1.00 x 0.745). Consequently, the 68-percent confidence interval, as shown by these data, is from 30.9 to 35.3 percent, and the 95-percent confidence interval is from 28.7 to 37.5 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squared standard errors of the estimates. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error; whereas, if there is a high negative correlation, the formula will underestimate the true standard error.

Illustration of the computation of the standard error of a difference. Suppose that we wish to compare the above estimate of 586,000 persons in poverty in the State of New Jersey with the estimate of 408,000 persons in poverty in the State of Massachusetts. The apparent difference between the number of persons in poverty in New Jersey and the number in Massachusetts is 178,000. By linear interpolation, table A-7 shows that the standard error on an estimate of 408,000 in Massachusetts to be approximately 22,000. The factor for total persons in poverty is 1.30, thus the final standard error is approximately 29,000. The standard error of poor persons in the State of New Jersey was shown to be 34,000. Therefore, the standard error of the estimated difference of 178,000 is about

$$\sqrt{(34{,}000)^2 + (29{,}000)^2} = 45{,}000.$$

Consequently, the 68-percent confidence interval for the 178,000 difference is from 133,000 to 223,000. Therefore, a conclusion that the average estimate of this difference, derived from all possible samples, lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95-percent confidence interval is from 88,000 to 268,000. Thus, we can conclude with 95 percent confidence that the number of poor persons in New Jersey is greater than the number of poor persons in Massachusetts.

Illustration of the comparison of percentages. Of the estimated 408,000 persons in poverty in the State of Massachusetts, 124,000 or 30.4 percent, are poor children 5 to 17 years old. By linear interpolation, table A-8 shows that the standard error on 30.4 percent (on a base of 408,000) is approximately 3.5 percent. The factor for the numerator of the percentage, children 5 to 17 years old in poverty, is 1.00 and the factor for Massachusetts shown in table A-6 is 0.756. Thus, the final standard error is 2.6 percent (3.5 x 1.00 x 0.756).

Suppose that we wish to compare the estimate of 33.1 percent for New Jersey with the above estimate of 30.4 percent for the State of Massachusetts. The apparent difference is 2.7 percent. The standard error of the difference is

$$\sqrt{(2.6)^2 + (2.2)^2} = 3.4.$$

Thus, the 95-percent confidence interval for the difference is from –4.1 percent (i.e., 2.7 – 2 x 3.4) to +9.5 percent (i.e., 2.7 + 2 x 3.4). Therefore, a conclusion that the average estimated difference, derived from all possible samples, lies within the range computed in this manner would be correct for roughly 95 percent of all samples. Because 0.0 lies between the

Table A-9. Factors to be Applied to Generalized Standard Errors in Tables A-7 and A-8: 1975

Characteristics	Total	Poor
FAMILIES, UNRELATED INDIVIDUALS, AND HOUSEHOLDS		
All families	0.60	0.60
All unrelated individuals	0.75	0.75
All households	0.60	0.60
All other categories	0.60	0.60
PERSONS		
All persons	1.30	1.30
Children under 18 years old	1.00	1.20
Children 5 to 17 years old	1.00	1.00
Persons 14 years and over	1.00	1.00
Persons 25 years and over	0.75	1.00
Persons 65 years and over	0.75	0.75
All other categories	0.75	1.00

limits of the 95-percent confidence interval, we cannot conclude with 95 percent confidence that there is a difference between the percent in New Jersey and the percent in Massachusetts, even though the percent in New Jersey is apparently greater.

Standard error of a ratio. Certain mean values for persons in families shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per family is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families}}{\text{total number of families}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families.

Case 1: There is at least one person having the characteristic in every family of the class: as for example, the mean number of persons per family. For ratios of this kind, the standard error is approximated by the following formula:

$$\sigma_{\left(\frac{x}{y}\right)} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho \left(\frac{\sigma_x}{x}\right)\left(\frac{\sigma_y}{y}\right)\right]}$$

The standard error of the estimated number of families, σ_y, and the standard error of the estimated number of persons with the characteristic in those families, σ_x, may be calculated by the methods described above. In the above formula, ρ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above examples, and for other ratios of this kind, use 0.7 as an estimate of ρ.

Case 2: The number of persons having the characteristic in a given family may be 0, 1, 2, 3, or more for example, the mean number of children. For ratios of this kind the standard error is approximated by the above formula but ρ is assumed to be zero. If ρ is actually positive, then this procedure will provide an overestimate of the standard error of the ratio.

Standard errors of estimated means and medians. Estimated standard errors are provided for the means and medians of published income distributions and do not need to be calculated by the user. However, some users may wish to combine two or more income distributions into a single distribution. The following sections are provided to enable the user to calculate standard errors for the estimate of means and medians for the combined distributions.

Medians. When combining two or more income distributions, the median of the distribution must be computed by the user. The median is the income at the center of the income distribution and may be approximated by linear interpolation within the group which contains it. Computation of the confidence interval for medians is described below.

The sampling variability of an estimated median depends upon the size of the base as well as on the distribution from which the median is determined. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence that the median based on all possible samples lies within the interval. The following procedure may be used to estimate a 68-percent confidence interval of a median based on sample data: (1) From table A-8, determine the preliminary standard error of a 50-percent characteristic using the appropriate base and multiply the standard error by the appropriate factor in table A-6 and the factor from table A-9; (2) add to and subtract from 50 percent the standard error determined in step (1); (3) multiply the values of the two points established in (2) by the base for the distribution to yield the confidence interval's upper and lower distribution points; (4) interpolating in the distribution of the characteristic, calculate the upper and lower confidence limits corresponding to the distribution points established in (3). A 95-percent confidence interval may be determined by finding the values corresponding to 50 percent plus or minus twice the standard error determined in step (1).

Illustration of the computation of a confidence interval for a median. This report shows that the median income of families with head 65 years and over in the State of New York is $10,180 on a base of 697,000 families.

1. From table A-8, the standard error on 50.0 percent (on a base of 697,000) is 2.9 percentage points. The factor shown in table A-9 for families is 0.60 and the factor shown in table A-6 for New York is 1.282. Thus, the standard error of 50.0 percent is 2.3.
2. To obtain a 95-percent confidence interval on an estimated median, add to and subtract from 50 percent twice the standard error found in (1). This yields percent limits of 45.4 and 54.6, which correspond to 316,000 (i.e., 0.454 x 697,000) and 381,000 (i.e., 0.546 x 697,000) families.
3. From table 11A, the income of 268,000 families was less than $8,000, and 74,000 had incomes

between $8,000 and $9,999. By linear interpolation, the lower confidence limit on the estimated median is found to be about

$$\$8{,}000 + \$2{,}000\left[\frac{316{,}000 - 268{,}000}{74{,}000}\right] = \$9{,}297.$$

Similarly, the income of 342,000 families was less than $10,000 and 71,000 families had incomes between $10,000 and $11,999. The upper confidence limit may be found by linear interpolation to be about

$$\$10{,}000 + \$2{,}000\left[\frac{381{,}000 - 342{,}000}{71{,}000}\right] = \$11{,}099.$$

Thus, the 95-percent confidence interval on this estimated median is from $9,297 to $11,099.

The confidence interval, as calculated above, for an estimated median may differ from one calculated using the standard errors present in the report for the following two reasons:

1. The medians and standard errors presented in this report were calculated from more detailed income distributions with $1,000 intervals whereas the intervals in the distributions presented in this report have intervals $2,000 or greater.
2. Rounding in the display of the standard errors in table A-8 and rounding in the computations in the example will primarily effect the length of the confidence interval (i.e., the upper minus the lower confidence limits). The reader should also note that for median incomes of $18,000 or more, the method of calculating median income and standard errors described here will produce different results than the published values since the latter were calculated using Pareto interpolation. Further discussion on the Pareto technique can be found on page 159, under "median income."

Illustration of the computation of the standard error of a mean. To get a rough estimate of the standard error of a mean, the following formula can be used:

$$\sigma_{\overline{x}} = d\sqrt{\frac{\sum_{i=1}^{c} p_i x_i^2 - \overline{x}^2}{y}}$$

where

p_i is the proportion of total cases in the i^{th} income class.

x_i is the midpoint of the i^{th} class, with the midpoint of the open-ended class taken to be 3/2 times its lower limit.

$\overline{x}$ is the mean value of the distribution. Note that the means provided in this report were calculated directly from the sample by taking the weighted estimate of household income divided by the weighted estimate of households.

y is the base of the distribution.

and

d is a constant which depends on the sample size, the sample design and the estimation procedure. The d values for each State, region, division and the United States are provided in column (2) of table A-6.

NOTE: When two or more distributions are combined, the mean of the combined distribution is

$$\overline{x} = \frac{1}{y}\sum_j \overline{x}_j y_j$$

where $\overline{x}_j$ is the mean of the j^{th} distribution, y_j is the base of the j^{th} distribution, and $y = \sum_j y_j$. This mean must be computed by the user.

PERSON 1X

Page 3

(If civilian 14+, begin with item 27. If Armed Forces member, skip to item 44.)

27. In 1975 how many weeks did . . . work either full time or part time not counting work around the house? Include paid vacation and paid sick leave.

(Mark weeks and skip to item 31) →

None (Ask 28)

28. Even though . . . did not work in 1975, did he spend any time trying to find a job?

Yes No (Skip to 30)

29. How many different weeks was . . . looking for work or on layoff from a job?

(Mark weeks) →

30. What was the main reason . . . did not work in 1975? Was he

Ill or disabled and unable to work
Taking care of home or family
Going to school
Could not find work
In Armed Forces
Retired
Doing something else
(Skip to item 44)

31. Interviewer Check Item
Number of weeks in item 27 is:

1-49 (Skip to 33)
50-52 (Ask 32)

32. Did . . . lose any full weeks of work in 1975 because he was on layoff from a job or lost a job?

Yes
No } (Skip to 36)

33. You said . . . worked about (item in item 27) weeks in 1975. How many of the remaining (52 minus entry in item 27) weeks was . . . looking for work or on layoff from a job?

(Mark weeks and ask 34) →

None

(Skip to 35)

34. Were the __________ weeks . . . was looking for work (or on layoff) all in one stretch?

Yes . . . 1 stretch
No . . . 2 stretches } (Go to 35)
No . . . 3+ stretches

35. (If the entries in items 27 and 33 add to 52 weeks, skip to item 36. Else ask 35) What was . . . doing most of the remaining weeks in 1975?

Was he

Ill or disabled and unable to work
Taking care of home or family
Going to school
In Armed Forces
Retired
Doing something else
(Go to item 36)

36. For how many employers did . . . work in 1975? If more than one at same time, only count it as one employer.

1 (Skip to 38)
2
3+ } (Ask 37)

37. Did . . . look for work between jobs in 1975?

Yes No

38. In the weeks that . . . worked, how many hours did . . . usually work per week?

(Mark hours) →

(Go to 39)

39. INTERVIEWER CHECK ITEM
Number of hours in item 38 is:

1-34 (Skip to 41) 35+ (Ask 40)

40. Did . . . work less than 35 hours for at least one week in 1975? Exclude time off with pay because of holidays, vacation, days off, or sickness.

Yes (Ask 41) No (Skip to 43)

41. How many weeks did . . . work less than 35 hours in 1975?

(Mark weeks) →

42. What was the main reason . . . worked less than 35 hours per week?

Could only find part time work
Wanted to work part time or could work only part time
Slack work or material shortage
Other [illegible]

HOUSEHOLD PAGE

NOW I HAVE A FEW QUESTIONS ABOUT YOUR HOUSEHOLD IN GENERAL

95. At any time during 1975, did you or any other person now living here purchase or receive government food stamps?
○ Yes ○ No – *Skip to item 96*

95A. In how many months during 1975 were these stamps purchased or received?
Tens ○ 1
Units ○ 1 2 3 4 5 6 7 8 9

96. In 1976, have you or any other person now living here purchased or received government food stamps?
○ Yes ○ No – *Skip to item 97*

96A. What was the most recent month in which they were received, not counting this month?
○ January ○ February ○ March
○ April ○ May ○ June

96B. In that month, how much was paid for food stamps?
$
○ Don't know

96C. What was the total value of these stamps?
$
○ Don't know

96D. Was that the full allotment to which this household was entitled?
○ Yes ○ No

96E. Does this household usually buy more food in a month than can be paid for with food stamps, not including nonfood items or restaurant meals?
○ Yes ○ No – *Skip to item 97*

96F. How much more is usually spent on food?
○ less than $5? ○ $5 to $15? ○ $16 – $25 ○ over $25

97. Does this family have any of the following –

	Yes	No
Savings account in banks, credit unions, or savings and loan associations	○	○
U.S. Savings Bonds	○	○
Checking accounts or cash	○	○

97A. *Ask if at least one "Yes" in item 97*
Is the total value of these, $5,000 or more?
○ Yes – *Skip to item 98* ○ No

97B. What is the total value of these?
$

98. Tenure *(Transcribe from Control Card item 7)*
○ Owned or being bought
○ Rented for cash – *Skip to item 102*
○ Occupied without payment of cash rent – *Skip to item 103*

99. What is the value of your house, that is, how much do you think it would sell for today, if it were for sale?
$
○ $100,000 +
○ Don't know

100. How much is owed on this property for mortgages, back taxes, or loans?
$
○ $100,000 +
○ Nothing – *Skip to item 105*
○ Don't know

101. Last month, what was your monthly mortgage payment?
$
○ $1,000 +
○ Nothing – *Skip to item 103*
○ Don't know

101A. Were real estate taxes included in that payment?
○ Yes
○ No } *Skip to item 103*

102. Last month, what did you pay for rent?
$
○ $1,000 +
○ Don't know

102A. *(In addition to your rent,)* do you pay separately for fuel or electricity?
○ Yes
○ No

103. Is this house (apartment) public housing, that is, is it owned or leased by a local housing authority?
○ Yes – *Skip to item 105* ○ No

104. Are you paying a lower rent because the Federal, State, or local government is paying part of the cost?
○ Yes ○ No

105. How many housing units are in this structure? Count occupied and vacant

1	2	3–4	5–9	10+
○	○	○	○	○

106. Is any member of this family contributing to the support of any person living in an institution, nursing home, hospital, or similar place?
○ Yes ○ No – *End interview*

Person	106A. What is the present age of the person(s) supported by this family?	106B. How much did the members of this family pay last month for this person's care?
#1		
#2

WORLD DEMOGRAPHIC MAPS

These three maps provide specific data on the fertility, population growth, and mortality patterns of the world. They were developed by the International Statistical Programs Center of the Census Bureau for the Office of Population, Agency for International Development. Each map measures 10½ x 16 inches and is printed in color.

World Fertility Pattern, 1972. (ISP-WCF-72) Births per 1,000 population are indicated for each country. Four separate tones of red and yellow show levels of fertility.

World Population Growth Patterns, 1972. (ISP-WCG-72) Annual rate of population growth is shown by percent for the countries of the world. Four separate tones of blue and yellow show levels of growth.

World Mortality Pattern, 1972. (ISP-WCM-72) Deaths per 1,000 population are indicated for each country. Three separate tones of brown and yellow show levels of mortality.

Each map is priced at 25 cents.

RELATED REPORTS FROM THE SIE IN THE P-60 SERIES

Three additional reports containing income and poverty data from the Survey of Income and Education are being published in the P-60 series of the **Current Population Reports.** There will be a separate report for each major region in the Nation, containing data for divisions and States within the region and the total United States.

These reports will contain income and poverty data for families, persons, and unrelated individuals, cross-classified by a broad range of socioeconomic and demographic characteristics similar in content to data published from the Current Population Survey. The income tables will include such characteristics as residence, tenure, age, race, size and type of family, number of children under 18 years old, number of earners, and occupation, work experience, and education of head. In addition to many of the above characteristics, the poverty tables will include information on reasons for not working, type of income, subsidized housing of renters, and living arrangements for unrelated individuals.

These reports will appear as **Current Population Reports**, Series P-60, No. 110 (Northeast), No. 111 (North Central), No. 112 (South), and No. 113 (West).
